Project Name	Project - Detecting Parkinson's Disease using Machine Learning

1. INTRODUCTION

1.1Project Overview

arkinson's disease is a progressive disorder of the central nervous system affecting movement and inducing tremors and stiffness. It has 5 stages to it and affects more than 1 million individuals every year in India. This is chronic and has no cure yet. It is a neurodegenerative disorder affecting dopamine-producing neurons in the brain. For detecting PD, various machine learning models such as logistic regression, naive Bayes, KNN, and forest decision tree were used, with the features used here being minimum-redundancy maximum-relevance and recursive feature elimination. The accuracy obtained was 95.3% using data from the UCI machine learning repository. The researchers found that the drawing speed was slower and the pen pressure is lower among Parkinson's patients. One of the indications of Parkinson's is tremors and rigidity in the muscles, making it difficult to draw smooth spirals and waves. It is possible to detect Parkinson's disease using the drawings alone instead of measuring the speed and pressure of the pen on paper. Our goal is to quantify the visual appearance (using HOG method) of these drawings and then train a machine learning model to classify them. In this project, We are using, Histogram of Oriented Gradients (HOG) image descriptor along with a Random Forest classifier to automatically detect Parkinson's disease in hand-drawn images of spirals and waves.

Purpose

By using machine learning techniques, the problem can be solved with minimal error rate. The voice dataset of Parkinson's disease from the UCI Machine learning library is used as input. Also, our proposed system provides accurate results by integrating spiral drawing inputs of normal and Parkinson's affected patients. Machine learning also allows for combining different modalities, such as magnetic resonance imaging (MRI) and single-photon emission computed tomography (SPECT) data. in the diagnosis of PD. By using machine learning approaches, we may therefore identify relevant features that are not traditionally used in the clinical diagnosis of PD and rely on these alternative measures to detect PD in preclinical stages or atypical forms. In recent years, the number of publications on the application of machine learning to the diagnosis of PD has increased. feasibility and efficiency of different machine learning methods in the diagnosis of PD, and (c) provide machine learning practitioners interested in the diagnosis of PD with an overview of previously used models and data modalities and the associated outcomes, and recommendations on how experimental protocols and results could be reported to facilitate reproduction. As a result, the application of machine learning to clinical and non-clinical data of different modalities has often led to high diagnostic accuracies in human participants, therefore may encourage the adaptation of machine learning algorithms and novel biomarkers in clinical settings to assist more accurate and informed decision making. While Parkinson's cannot be cured, early detection along with proper medication can significantly improve symptoms and quality of life.

Title: "Machine Learning for the Diagnosis of Parkinson's Disease,"

Published in: 2021

This paper conveys extremely about the importance of Diagnosis of Parkinson's disease (PD) is commonly based on medical observations and assessment of clinical signs, including the characterization of a variety of motor symptoms. However, traditional diagnostic approaches may suffer from subjectivity as they rely on the evaluation of movements that are sometimes subtle to human eyes and therefore difficult to classify, leading to possible misclassification. In the meantime, early non-motor symptoms of PD may be mild and can be caused by many other conditions. Therefore, these symptoms are often overlooked, making diagnosis of PD at an early stage challenging. To address these difficulties and to refine the diagnosis and assessment procedures of PD, machine learning methods have been implemented for the classification of PD and healthy controls or patients with similar clinical presentations (e.g., movement disorders).

Title: "The Parkinson's Disease Detection using Machine Learning Techniques."

Published in: 2020

The Parkinson's disease is progressive neuro degenerative disorder that affects a lot only people significantly affecting their quality of life. It mostly affects the motor functions of human. The main motor symptoms are called "parkinsonism" or "parkinsonian syndrome". The symptoms of Parkinson's disease will occur slowly, the symptoms include shaking, rigidity, slowness of movement and difficulty with walking, Thinking and behavior change, Depression and anxiety are also common. There is a model for detecting Parkinson's using voice. The deflections in the voice will confirm the symptoms of Parkinson's disease. This project showed 73.8% efficiency. In this model, a huge amount of data is collected from the normal person and previously affected person by Parkinson's disease. these data are trained using machine learning algorithms. From the whole data 60% is used for training and 40% is used for testing. The data of any person can be entered in db to check whether the person is affected by Parkinson's disease or not.

Title: "Machine Learning Approaches for Detection and Diagnosis of Parkinson's Disease,"
Published in: 2021

Parkinson's disease (PD) is disabling disease that affects the quality of life. It happens due to the death of cells that produce dopamine's in the substantia nigra part of the central nervous system (CNS) which affects the human body. People who have Parkinson's disease feel difficulty in doing activities like speaking, writing, and walking. However, speech analysis is the most considered technique to be used. Researches have shown that 90% of the people who suffer from Parkinson's disease have speech disorders. With the increase in the severity of the disease, the patient's voice gets more and more deteriorated. The proper interpretation of speech signals is one of the important classification problems for Parkinson's disease diagnosis. This paper contemplates the survey work of the machine learning techniques and deep learning procedures used for Parkinson's disease classification.

3.2 Ideation & brainstorming

3.3 Proposed Solution

S.NO	Parameter	Description
1.	Problem Statement (Problem to be solved)	<p>Parkinson's disease is a neurodegenerative movement disease where the symptoms gradually develop start with a slight tremor in one hand and a feeling of stiffness in the body and it became worse over time.</p> <p>It affects over 6 million people worldwide. At present there is no conclusive result for this disease by non-specialist clinicians, particularly in the early stage of the disease where identification of the symptoms is very difficult in its earlier stages. The disease is majorly is affects the</p>

		<p>individuals who are living in village areas with their respective ages over 40 and 50 which outcomes itself as a reason for Parkinson's disease to occur at unexpected times. Lack of adequate knowledge poses a barrier in the provision of appropriate treatment and care for individuals with Parkinson's Disease which causes Dopamine deficiency in the secondary stage. We researched and analyzed the data that was gathered from all over the network for figuring out the accurate reason for why this disease majorly affects the agricultural life. So, we found that as Parkinson's disease is believed to be caused by a combination of environmental risk factors and genetic susceptibility. As use of pesticides and Parkinson's disease have been associated,</p>
--	--	---

		but it has not been narrowed down to specific pesticides or how the amount of exposure contributed. So most specifically, farmers are more prone to Parkinson's Disease than the general population people.
2.		It processes the breathing signals using a neural network that infer whether the person has Parkinson's disease, and if they are identified then it assesses the severity of their disease in accordance with the Movement Disorder Society Unified Parkinson's Disease using ML algorithms. User can place their values and interact with the friendly user assistance bot which guides the person in using the application. Great classification of the right variation of true and fake samples of data that is entered by users in the application.
3.	Novelty / Uniqueness	Parkinson's Disease is

		<p>detected at the secondary stage only (Dopamine deficiency) which leads to medical challenges. Also, doctor must manually examine and suggest medical diagnosis in which the symptoms might vary from person to person so suggesting medicine is also a challenge. So , the disease examination varies at different instances of the medical operations. Here by using machine learning methods, the problem can be addressed with very less error rate. The voice dataset of Parkinson's disease from the UCI Machine learning library is used as input. Also, our proposed system provides accurate results by integrating spiral drawing inputs of normal and Parkinson's affected patients. We propose a hybrid and accurate results analyzing patient both voice and spiral drawing data. This application offers medical advice and solutions as the next step after user is confirmed based on the presence of Parkinson's disease. This can be used direct by medical team</p>
--	--	--

		for analyzing and offering the solutions at much positive scaling time.
4.	Social Impact / Customer Satisfaction	An automated chatbot controls the user interaction environment. Personalize the UI experience. Improves accurate result as expected. Accurate prediction at good time complexity.
5.	Business Model (Revenue Model)	Solutions prospects of improvement. Suits for better saving of involvements. Economical Development . Easy interface.
6.	Scalability of the Solution	Good conversation with ethnicity people . Saves enough time for performing internal operations. On the spot result for the users. It does not require for the users to spend some money in offering their basic data into the model.

3.4 Problem solution fit

Define CS, fit into	1. CUSTOMER SEGMENT(S) CS <small>Who is your customer?</small> 1. Senior citizen of the place 2. First time app users 3. Medical team 4. Family users	6. CUSTOMER CC <small>What constraints prevent your customers from taking action or limit their choices of solutions? i.e., spending power, budget, no cash, network connection, available devices.</small> 1. Easy interface 2. Budget 3. Finding difficult to use the app	5. AVAILABLE SOLUTIONS AS <small>Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have? i.e., pen and paper is an alternative to digital recording</small> 1. Users can be aware of the disease priorly 2. It shall be a productive and precise application	Explore AS.
	2. JOBS-TO-BE-DONE / PROBLEMS J&P <small>Which jobs-to-be-done (or problems) do you address for your customers? There could be more than one; explore different sides.</small> 1. Making aware of this application. 2. No idea about organizing the data	9. PROBLEM ROOT CAUSE RC <small>What is the real reason that this problem exists? What is the back story behind the need to do this job? i.e. customers have to do it because of the change in requirements.</small> 1. Detection and prediction of the disease 2. Less intervention of external medical team	7. BEHAVIOUR BE <small>What does your customer do to address the problem and get the job done? i.e. directly related: find the right solar panel installer, calculate usage and benefits; indirectly associated: customers spend free time on volunteering work (i.e. Greenpeace)</small> 1. The input data is feed into the application interface 2. Recommends and guides various actions of solution after the disease is detected 3. Building and integrating the chatbot that interacts with the user regarding the disease.	
Identify strong TR & EM	3. TRIGGERS There is no proper application for to know about the disease better.	10. YOUR SOLUTION It processes the breathing signals using a neural network that infer whether the person has Parkinson's disease, and if they are identified then it assesses the severity of their disease in accordance with the Movement Disorder Society Unified Parkinson's Disease using ML algorithms. Great classification of the right variation of true and fake samples of data that is entered by users in the application.	8. CHANNELS of BEHAVIOUR CH Online: 1. Checks for available doctors 2. Carefully analyses about the disease 3. Identifies for nearby medical centres OFFLINE: 1. Checks for presence of the doctor 2. Recommends medical steps from the natural view 3. Hospital availability	Extract online & offline CH of BE
	4. EMOTIONS: BEFORE / AFTER EM Due to incomplete solution and result, the patient gets dissatisfied and lacks positivity.

4. REQUIREMENTS ANALYSIS

4.1 Functional requirement

Following are the functional requirements of the proposed solution.

FR NO.	Functional requirements(Epic)	Sub requirements(story/sub-task)
FR-1	User Registration	Registration through Form. Registration through Gmail.
FR-2	User Authorization	Verifying the user's account.
FR-3	Input data	Application received the data and processes its roles.
FR-4	Data classification	Classification of the real data for the user.
FR-5	Accuracy verification	Accuracy is determined in the application.
FR-6	Time efficient usage	Interaction with the chatbot till

		the result gets generated for the user
FR-7	Medical recommendations	User receives the medical suggestions and assistance for to offer speed
FR-8	Data extraction	User gets their personal disease report data from the application.

4.2 Non-Functional requirements

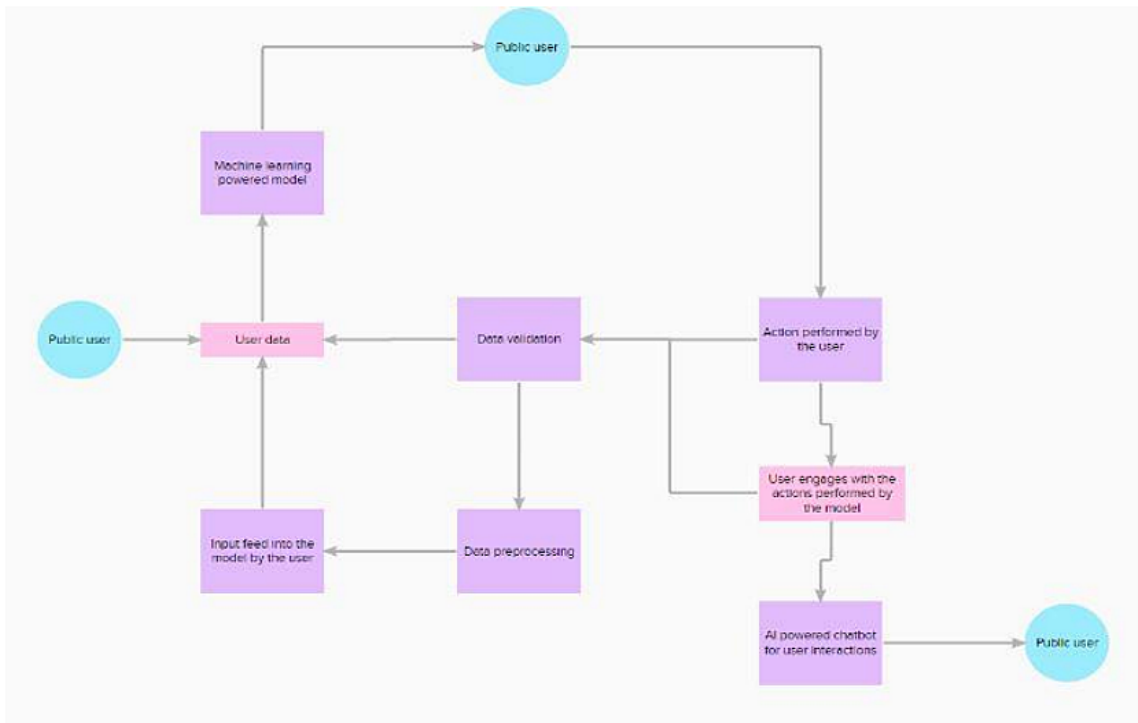

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The application can be used for accurate prediction and classifier of the true and fake input data sample.
NFR-2	Security	User's data is well encrypted using stable machine learning algorithms.
NFR-3	Reliability	The application is monitored periodically in terms of its constant prediction ability, quality, and availability towards the user.
NFR-4	Performance	It classifies the images and predicts the disease with careful accuracy output
NFR-5	Availability	The application is active throughout the day. While awaiting the prediction result, User can interact with the chatbot for knowing important details. If the application doesn't respond for the user, then the automated

		chatbot will forward the issue to our server then it can be resolved at that instance

5.2 Solution & Technical Architecture

Solution Architecture

Technical Architecture

Table-1 Components & technology

S.No	Components	Description	Technology
1	User Interface feature	How user interacts with application e.g., Web UI	HTML, CSS, JavaScript, Firebase (Web techniques)
2	Application Logic-1	Logic for a process in the application	React and Firebase
3	Application Logic-2	Information visibility of the disease towards the user	IBM Watson Assistant (Cloud)
4	Cloud Database	Database Service on Cloud	IBM DB2
5	Data Analysis	Data preprocessing and machine learning	Data collection and preprocessing, Exploratory Data Analysis (EDA), Data visualization

6	Machine Learning	Important methods of Machine Learning	Data mining – Regression, Classification and Clustering
7	Machine learning methods	Data mining	Random Forest classifier (ML), Support Vector Machines(SVM), Label encoding and One-hot encoding, K Nearest Neighbor (KNN) algorithm, XG boost algorithm (Gradient boosting)
8	Artificial Intelligence	Computer vision to detect the Parkinson's disease C	Computer vision with OpenCV
9	Web application	Alternative to python flask	React and alternative web framework technique
10	Infrastructure (Server / Cloud)	Application Deployment on Local System / Cloud	Cloud Server Configuration: IBM Watson (Cloud)

Table-2 Application Characteristics

S.NO	Characteristics	Description	Technology
1	Machine learning python Frameworks	List the open-source frameworks used	Numpy, Pandas, metrics, XG boost, Python Flask (Web), Scikit learn (Sklearn), Tensor flow
2	Security Implementations	List all the security / access controls implemented, use of firewalls etc.	Encryptions, Decryptions

3	Scalable Architecture	Justify the scalability of architecture (3 – tier, Micro-services)	Justify the scalability of architecture (3 – tier, Micro-services)
4	Availability	Justify the availability of application (e.g., use ofload balancers, distributed servers etc.)	IBM Watson – Can easily be accessed
5	Performance	Design consideration for the performance of the application (number of requests per sec, use of Cache, use of CDN's) etc.	Web applications (React , JavaScript, Firebase)

5.3 User stories

Use the below template to list all the user stories for the product

User Type	Functional Requirements(epic)	User Story Number	User Story/ Task	Acceptance criteria	Priority	Release
Customer (public user)	Account creation	USN-1	As a user, I can connect my google into the application	As a user, I can retrieve the result data from the application for data storage for further medical research uses.	High	Sprint-1
Input data	Adding data	USN-2	As a user, I can feed my data as the	I can cross verify the data that	High	Sprint-1

			input into the application for it to classify the true fake data	entered in the initial step		
Data validation	Checking accuracy	USN-3	As a user, I can check the ability and accuracy of the model in obtaining the required information	I can log into my account and check the capability of the model	High	Sprint-2
Classification	Data classification	USN-4	As a user, I can view the real data	I can verify my data with the real data	High	Sprint-2
App work	Work flow	USN-5	As a user, I can examine the working action of the application model	I can view how the application works and responds to the actions imposed	High	Sprint-2
Image classification	Checking for the disease	USN-6	As a user, I can verify with the application that the image is identified with the actual disease with the help of the	I can confirm that the data shows the accurate result	High	Sprint-3

			trained and tested data's			
User interaction	AI-powered chatbot	USN-7	As a user, I can interact with the automated chatbot to engage my time till the application processed the accurate result in a meanwhile	I can see the results from the interaction with the chatbot	High	Sprint-3
Medical assistance	Medical Suggestion	USN-8	As a user, I can get medical advises and recommendations for to boost the action of curing the disease	I can get enough assistance by getting the suggestions for curing the disease	High	Sprint-3
Data extraction	Obtaining the data	USN-9	As a user, I can retrieve the result data from the application for data storage for further medical research uses.	I can download the result in the form of data as a proof to show to medical teams	High	Sprint-4

6. PROJECT PLANNING & SCHEDULING

6.1 Sprint planning & Estimation

Sprint	Functional Requirements(Epic)	User story number	User story/task	Story points	Priority	Team Members
Sprint-1	Viewing Home Page for the web application	USN-1	As a user, I can research and know the sample disease images of Parkinson. Also collecting sample data to learn more about the disease.	4	Low	Priyankadevi Keerthana Swetha Lalithkamal
Sprint-1	Sign Up Page	USN-2	I need to collect data (images of spirals and waves drawn by healthy people and Parkinson's patients)	4	High	Priyankadevi Keerthana Swetha Lalithkamal
Sprint-1		USN-3	I need to learn and understand the data	2	High	Priyankadevi Keerthana Swetha Lalithkamal
Sprint-2		USN-4	I need to	6	High	Priyankade

			prepare, clean the data, and process the data for modelbuilding by doing preprocessing activities such as EDA and data visualization.			vi Keerthana Swetha Lalithkam al
Sprint-2		USN-5	I need to visualize the data for to check for any outliers and processing the data accordingly.	6	High	Priyankade vi Keerthana Swetha Lalithkam al
Sprint-2		USN-6	I need to build the model using Data mining processes such as Random ForestClassifier, K Nearest Neighbor (KNN) from regression, classification, and clustering	6	Medium	Priyankade vi Keerthana Swetha Lalithkam al

			techniques.			
Sprint-3		USN-7	I need to measure the performance of the model using regression metrics	2	Medium	Priyankadevi Keerthana Swetha Lalithkamal
Sprint-3		USN-8	I need to build the website for the model application using HTML, CSS, JavaScript etc followed by user sign up page creation in sprint 1. It is then completed by designing the application website.	4	High	Priyankadevi Keerthana Swetha Lalithkamal
Sprint-3		USN-9		7	Medium	Priyankadevi Keerthana Swetha Lalithkamal
Sprint-3		USN-10		4	High	Priyankadevi Keerthana

						Swetha Lalithkam al
Sprint-4		USN-11		5	Medium	Priyankade vi Keerthana Swetha Lalithkam al
Sprint-4		USN-12	I need to build the website for the model application using HTML, CSS, JavaScript etc followed by user sign up page creation in sprint 1. It is then completed by designing the application website.	4	Medium	Priyankade vi Keerthana Swetha Lalithkam al
Sprint-4		USN-13	I need to check that model works fine in the application for the user.	6	High	Priyankade vi Keerthana Swetha Lalithkam al
Sprint-4		USN-14	I need to deploy the	5	Medium	Priyankade

			Machine Learning model that was built using cloud environment from IBM. And configuring the data of the user in IBM warehouse service called as db2.			vi Keerthana Swetha Lalithkamal
Sprint-4		USN-15	As a user, I can receive a diagnosis in addition to recommendations on what I should do now.	5	High	Priyankadevi Keerthana Swetha Lalithkamal

6.2 Sprint delivery schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)

Sprint-1	10	6 Days	24 Oct 2022	29 Oct 2022	10	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

6.3 Reports from JIRA

The screenshot displays the Jira Software interface for the project "Detecting Parkinsons Disease Using Machine Learning". The main view is the "Backlog", which lists issues organized into sprints. The first sprint, "DPDUML Sprint 1" (Oct 24 - Oct 31), contains three issues: "VIEWING HOME PAGE FOR THE W..." (DPDUML-4), "SIGN UP PAGE" (DPDUML-5), and "LOGIN" (DPDUML-6). The second sprint, "DPDUML Sprint 2" (Nov 1 - Nov 6), contains two issues: "AUTHORIZATION" (DPDUML-10) and "DASHBOARD" (DPDUML-13). All issues are marked as "SUBMITTED AND UNDER REVIEW". The interface includes a search bar, filters, and a "Create issue" button. The bottom of the screen shows the Windows taskbar with the time 3:29 AM on 11/19/2022.

Out[38]: XGBClassifier()

Converging the above classification algorithms and performance metric using Voting Classifier.

```
In [37]: from sklearn.ensemble import VotingClassifier
VC = VotingClassifier(estimators=[('Classification_model',Classification_model),('Classification_tree',Classification_tree),('Classification_random',C
Model_VC = VC.fit(x_train, y_train)
Model_prediction = VC.predict(x_test)
Model_accuracy = accuracy_score(y_test,pred_gnb)
print(Model_accuracy)
```

0.8813559322033898

XGBClassification - Supervised Machine Learning

```
In [38]: Model_XG = XGBClassifier(random_state=0)
Model_XG.fit(x_train,y_train)
```

Out[38]: XGBClassifier()

Saving the model

```
In [44]: import pickle

with open( 'Parkinson_MLmodel.sav', 'wb') as f:
    pickle.dump(Model_XG,f)

with open('standardScaler.sav', 'wb') as f:
    pickle.dump(Scaler_data,f)
```

7.2 Feature 2

We have created an Application with Home Page (After logging in by the user), Layout and Predict Page.

```

Login Page

Disease input data by registering in this Page:

The screenshot shows a web application interface for the Parkinson's Disease Detection Prediction System. On the left, a blue sidebar contains a rocket icon, the text "Welcome Parkinson's Disease Detection Prediction System", and a "Home" button. The main area has a header with "Home" and "Show Data" buttons. Below the header, it says "Please enter the following informations:". There are two columns of input fields, each with a label and an asterisk indicating it is required. The fields are: MDVP:F0(Hz) *, MDVP:F1(Hz) *, MDVP:F0(Hz) *, MDVP:Jitter(%) *, MDVP:Jitter(Abs) *, MDVP:RAP *, MDVP:PPQ *, Jitter:DDP *, MDVP:Shimmer *, MDVP:Shimmer(dB) *, Shimmer:APQ3 *, Shimmer:APQ5 *, MDVP:APQ *, and Shimmer:DDA *.

Please enter the following informations:	
MDVP:F0(Hz) *	MDVP:F1(Hz) *
MDVP:F0(Hz) *	MDVP:Jitter(%) *
MDVP:Jitter(Abs) *	MDVP:RAP *
MDVP:PPQ *	Jitter:DDP *
MDVP:Shimmer *	MDVP:Shimmer(dB) *
Shimmer:APQ3 *	Shimmer:APQ5 *
MDVP:APQ *	Shimmer:DDA *

8.2 User Acceptance Testing

1. Purpose of Document

The purpose of this document is to briefly explain the test coverage and open issues of the [ProductName] project at the time of the release to User Acceptance Testing (UAT)

2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	0	1	1	0	2
Duplicate	0	0	0	0	0
External	2	2	0	1	5
Fixed	1	0	0	0	1
Not Reproduced	0	0	0	0	1
Skipped	0	0	0	0	0
Won't Fix	0	0	0	0	0
Totals	3	3	1	1	8

3. Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Login / Register	8	0	0	8
Home page	1	0	0	1
Logout page	2	0	1	1
Prediction	10	0	0	10
Version control	2	0	0	2

9. RESULTS

9.1 Performance Metrics

Classification Model: Confusion Matrix, Accuracy Score & Classification Report

```
XGBClassification - Supervised Machine Learning

In [38]: Model_XG = XGBClassifier(random_state=0)
         Model_XG.fit(x_train,y_train)

Out[38]: XGBClassifier()

Assessing the model using metrics

In [39]: y_predict = Model_XG.predict(x_test)
         print(accuracy_score(y_test,y_predict)*100)

96.61016949152543

Hence by reducing the overfitting using XGBoost Classifier, we are getting accuracy_score of 98.30% for the model

Confusion metrics

In [40]: from sklearn.metrics import confusion_matrix
         ypre = Classification_model.predict(x_test)
         ypre = (ypre>0.5)
         confusion_matrix(y_test,ypre)

Out[40]: array([[20,  4],
               [ 7, 28]])

F1 score

In [41]: from sklearn.metrics import f1_score
         Variation_score = f1_score(y_test, Model_XG.predict(x_test), average='binary')
         print(Variation_score/0.01)

97.14285714285714
```

10. ADVANTAGES & DISADVANTAGES

10.1 Advantages

- We developed a model using the XG Boost Classifier using sklearn module of python to detect if an individual has Parkinson's Disease or not. We got the machine learning model with 96.61% accuracy, which is good as our dataset contains good labels and values.
- More accuracy in the model
- The data of any person can be entered in db to check whether the person is affected by Parkinson's disease or not.

10.2 Disadvantages

- Packages to be installed
- It produces fake results if the input data is entered wrong

11. CONCLUSION

It is possible to detect Parkinson's disease using the drawings alone instead of measuring the speed and pressure of the pen on paper. Here, we presented included studies in a high-level summary, providing access to information including machine learning methods that have been used in the diagnosis of PD and associated outcomes, types of clinical, behavioral, and biometric data that could be used for rendering more accurate diagnoses, potential biomarkers for assisting clinical decision making, and other highly relevant information, including databases that could be used to enlarge and enrich smaller datasets. In summary, realization of machine learning-assisted diagnosis of PD yields high potential for a more systematic clinical decision-making system, while adaptation of novel biomarkers may give rise to easier access to PD diagnosis at an earlier stage.

12. FUTURE SCOPE

Following years of minimal progress in the treatment of Parkinson's disease, pioneering pipeline therapies such as those previously discussed offer hope to those affected by this devastating condition.
